

BQE: 3-way flanged valve, PN 16

BQE

Improving energy efficiency

Efficient use in continuous control systems

Features

- Continuous control of cold and hot water in closed circuits¹
- Water quality as per VDI 2035
- In combination with valve actuators AVM 322(S), AVM 234S and AVF 234S as control unit
- Not suitable for drinking water or potentially explosive atmospheres
- Valve with flange connection as per EN 1092-2, seal form B
- Regulating valve, free of silicone grease, painted black
- Equal-percentage control passage characteristic, can be set with SUT (SAUTER Universal Technology) valve actuators to linear or quadratic
- Mixing passage, linear characteristic
- The control passage is closed when the spindle is moved out
- Used as control valve or as distribution valve
- Valve body with seat made of grey cast iron
- Stainless-steel spindle
- Plugs made of stainless steel with metal-to-metal seal
- Stuffing box made of stainless steel with wiper ring and double O-ring seal made of EPDM

Technical data

Parameters	
Nominal pressure	PN 16
Connection	Flange as per EN 1092-2, form B
Valve characteristic, control passage	Equal-percentage
Valve characteristic, mixing passage	Linear
Control ratio of valve	> 30:1
Stuffing box	2 EPDM O-rings
Leakage rate	Class III as per DIN EN 60534-4 (0.001 x K_{vs})
Valve stroke	20 mm (DN 65...80) 40 mm (DN 100...150)
Ambient conditions	
Operating temperature ²	-10...150 °C
Operating pressure	Up to 120 °C 16 bar At 150 °C 14.4 bar Between 120 °C and 150 °C, a linear interpolation can be performed
Standards and directives	
Pressure and temperature data	EN 764, EN 1333
Flow parameters	EN 60534, (page 3)
Pressure equipment directive	97/23/EC (fluid group II) With CE label

¹ Air humidity must not exceed 75%

² At temperatures below 0 °C, use a stuffing box heater. Use adaptor (accessory) at temperatures above 130 °C

Overview of types

Type	Nominal diameter	k_{vs} value	Weight
BQE065F300	DN 65	63 m ³ /h	19 kg
BQE080F300	DN 80	100 m ³ /h	24 kg
BQE100F300	DN 100	160 m ³ /h	34 kg
BQE125F300	DN 125	220 m ³ /h	52 kg
BQE150F300	DN 150	320 m ³ /h	76 kg

Accessories

Type	Description
0372336180	Adaptor (required when temperature of the medium is 130...150 °C) from DN 65
0378284100	Stuffing box heater 230V~, 15 W for medium below 0 °C
0378284102	Stuffing box heater 24V~, 15 W for medium below 0 °C
0378369101	Complete replacement stuffing box for DN 65...100

Combination of BQE with electric actuators

i Warranty: The technical data and pressure differences indicated here are applicable only in combination with SAUTER valve actuators. The warranty does not apply if used with valve actuators from other manufacturers.

i Definition of Δp_s : Maximum admissible pressure drop in the event of a malfunction (pipe break after the valve) at which the actuator reliably closes the valve by means of a return spring.

i Definition of Δp_{max} : Maximum admissible pressure drop in control mode at which the actuator reliably opens and closes the valve.

Combination of BQE with electric actuators, actuating power 1000 N

Actuator	AVM322F120 AVM322F122	AVM322SF132
Actuating power	1000 N	1000 N
Control signal	3-point	0...10 V
Running time	120/240 s	120/80 s
Δp [bar]		
As control valve	Δp_{max}	Δp_{max}

⚠ At temperatures above 130 °C, accessories are required

Description of operation

The valve can be moved to any intermediate position with an electric actuator. When the spindle is moved out, the control passage of the valve is closed. These valves may be used as control valves or distribution valves. The flow direction marked on the valve must be observed. The flow parameters correspond to EN 60534.

These control valves are characterised by their reliability and precision and make an important contribution towards environmentally friendly regulation. They meet difficult challenges such as the quick-closing function, overcoming differential pressures and controlling medium temperatures, all with a low noise level.

The valve spindle is automatically and firmly connected to the actuator spindle. The stainless steel plug controls the equal-percentage flow rate in the control passage. To compensate for the complementary characteristic of the consumer and ensure a constant quantity of medium regardless of the valve position, the mixing passage acts with a linear characteristic. The tightness of the valve is ensured by the seat incorporated in the body.

The stuffing box is maintenance-free. This consists of a stainless steel body, two O-rings, a wiper ring and a grease reserve. This is free of silicone grease, and silicone oil may not be used for the spindle.

Intended use

This product is only suitable for the purpose intended by the manufacturer, as described in the "Description of function" section.

All related product documents must also be adhered to. Changing or converting the product is not admissible.

Notes on engineering and installation

The valves are combined with the valve actuators without a spring return or with valve actuators with a spring return. The actuator is mounted directly on the valve and fastened with screws. The actuator is connected with the valve spindle automatically. When the system is commissioned, the actuator moves out and the connector closes automatically when it reaches the lower valve seat. The stroke of the valve is also detected by the actuator, and no further adjustments are required. Therefore the force on the seat is always the same and the smallest amount of leakage is ensured. With the SUT actuators, the characteristic of the control passage can be set to linear or quadratic as required.

Declaration on materials and the environment	MD 56.118

Fitting position

The final control element can be fitted in any position, but the hanging position is not recommended. Condensate, drops of water, etc. must be prevented from entering the actuator. When installed horizontally, and with regard to the valve spindle, the admissible actuator or support weight, without structural support, is max. 25 kg.

When the actuator is mounted on the valve, make sure the plug is not twisted on the seat (this can damage the sealing surface). When insulating the valve, it may only be insulated up to the connecting clip of the actuator.

To increase the functional reliability of the valves, the system should conform to DIN/EN 14336 (heating systems in buildings). DIN EN 14336 states, amongst other things, that the system has to be flushed through before being put into service.

Using with water

So that impurities are retained in the water (welding beads, rust particles, etc.) and the plug seal is not damaged, we recommend installing collecting filters, for example one for each floor or pipe run. Water requirements according to VDI 2035. When using an additive in the water, the compatibility of the materials must be checked with the manufacturer of the medium. The materials table shown below may be used. When glycol is used, we recommend using a concentration of between 20% and 55%.

Other information regarding hydraulics and noise in systems

The valves can be used in a low-noise environment. To prevent noise, the pressure differences Δp_{\max} listed below should not be exceeded.

The pressure difference Δp_v is the maximum pressure that may act on the valve regardless of the stroke position, in order that the risk of cavitation and erosion is limited. These values are irrespective of the actuator force. The cavitation accelerates wear on the plug and seat in the valve and causes noises. To prevent cavitation, the pressure differential on the valve should not exceed the value Δp_{krit} :

$$\Delta p_{\text{krit}} = (p_1 - p_v) \times 0.5$$

p_1 = upstream pressure before the valve (bar)

p_v = steam pressure at operating temperature (bar)

The calculation works with absolute pressure.

PDM. For the spring return, the stated Δp_s values are also the admissible differential pressure up to which the actuator can guarantee that the valve is closed in the event of an incident. Because this is an emergency function with a fast stroke movement (using a spring), this value can exceed Δp_{\max} .

Flow-rate chart

-----	Δp_v when used as a control valve

Additional version information

Valve body made of grey cast iron as per EN 1561, code EN-GJL-250, material number EN-JL 1040 with smooth drilled flanges as per EN 1092-2, seal form B.

Valve body protected by matt paint RAL 9005 jet black.

Fitted in the piping with welding flange as per EN 1092-1.

Valve fitting length as per EN 558-1, basic series 1.

Flat seal on valve body made of asbestos-free material.

Material numbers as per DIN

	DIN materials	DIN code
Valve body	EN-JL 1040	EN-GJL-250 (GG25)
Valve seat, control passage	EN-JL 1040	EN-GJL-250
Valve seat, mixing passage	1.4021	X20Cr13
Spindle	1.4021	X20Cr13
Plug	1.4021	X20Cr13
Stuffing box	1.4104	X12CrMoS-17

Additional details on the definitions of pressure difference

Δp_v :

Maximum admissible pressure difference over the valve at every stroke position, limited by noise level and erosion.

With this parameter, the valve is characterised as a flow element with specific hydraulic behaviour. Monitoring the cavitation and erosion along with the associated noise increases the service life and the operational capacity.

Δp_{max} :

Maximum admissible pressure difference over the valve at which the actuator can reliably open and close the valve.

The following are considered: Static pressure and flow effects. This value ensures trouble-free stroke movement and closing of the valve. The value Δp_v of the valve is never exceeded.

Δp_s :

Maximum admissible pressure difference over the valve in the event of a malfunction (e.g. power failure, excessive temperature or pressure, pipe break) at which the actuator can close the valve tightly and, if necessary, maintain the entire operating pressure against atmospheric pressure. Because this is a quick-closing function with a rapid stroke movement, Δp_s can be greater than Δp_{max} or Δp_v . The disruptive flow effects that arise here are quickly passed through and are of minor importance in this mode of operation.

For 3-way valves, the values only apply to the control passage.

Δp_{stat} :

Line pressure behind the valve. This essentially corresponds to the idle pressure when the pump is switched off, caused for example by the fluid level in the system, increased pressure due to pressure tanks, steam pressure, etc.

For valves that close with pressure, the static pressure plus the pump pressure are used.

Characteristic for actuators with positioner

On actuator AVM 322(S), AVM 234S or AVF 234S

Equal-percentage/linear/quadratic

Disposal

When disposing of the product, observe the currently applicable local laws.

More information on materials can be found in the Declaration on materials and the environment for this product.
